

AIRLINES SERVICES

Proposed by <https://www.appsintellect.org/>

10th September 2023

User Manual Version 3.8

GOALS

* Firefox is recommended

Using one unique web based / database tool, accessible from any browser *, Airlines can:

- Configure their fleet, aircraft types, hourly operational costs, crew costs, turn around times
- Plan graphically their routes using a 3 Dimensions map,
- Exploit main results from a 4 Dimensions trajectory such as trip duration, distance flown, fuel consumptions, etc.
- Choose the best aircraft
 - to minimize Costs,
 - to minimize Costs per Available Seat Miles,
 - to maximize Seat Miles
- Support flight leg planning through fuel estimation
- ...

Benefits of a full-fledged interactive 3D Globe with street maps hence runways

BROWSER RECOMMENDATION

AVOID BROWSER ERROR RAISED WHEN TRYING TO ACCESS [OPEN STREET MAP](#) TILES

Context : [open street map](#) is one of the “tile” providers to support displaying geo referenced map over the globe

Problem manifestation : no underlying map appears when the open globus map is displayed

Verification : you are using one the following browser : edge, chrome, others but not using firefox

Confirmation: open the browser web tools and select the console tool

Access to fetch at '<https://c.tile.openstreetmap.org/6/10/23.png>' from origin '<https://airlineservices.eu.pythonanywhere.com>' has been blocked by CORS policy:

No 'Access-Control-Allow-Origin' header is present on the requested resource.

If an opaque response serves your needs, set the request's mode to 'no-cors' to fetch the resource with CORS disabled.
<https://c.tile.openstreetmap.org/6/10/23.png>:l

Failed to load resource: net::ERR_FAILED

To ensure displaying globe with underlying street map , recommendation is to use FireFox

TOOL MAIN CONFIGURATION

3 different airlines have been configured with different parameters – for demonstration purpose

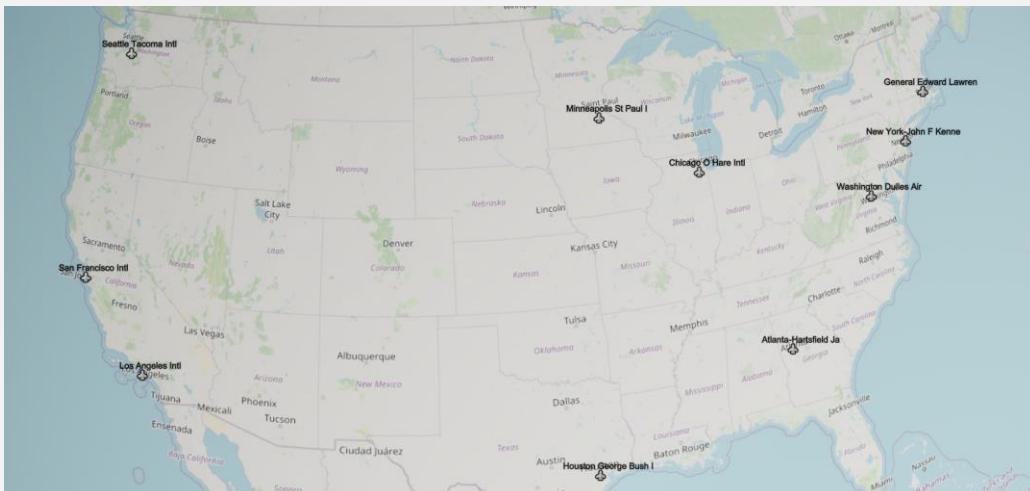

Airline Configuration data is stored in a SQL database

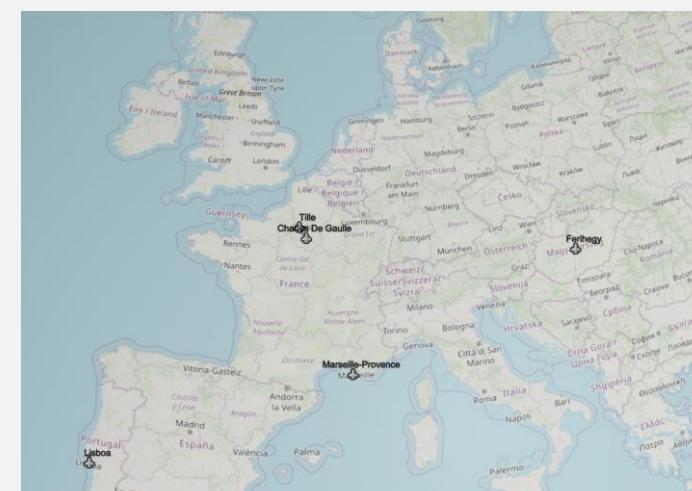

Each airline has its own map initial limits

Future: changing the airline will zoom again to see all the airports of the selected airline

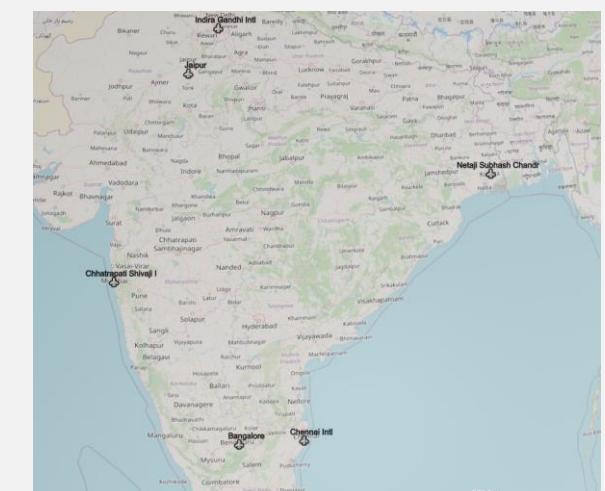

AmericanWings

EuropeanWings

IndianWings

Help Informations

Help

This help is displayed each time the user clicks on the question mark  available in the upper right corner of the navigation bar.

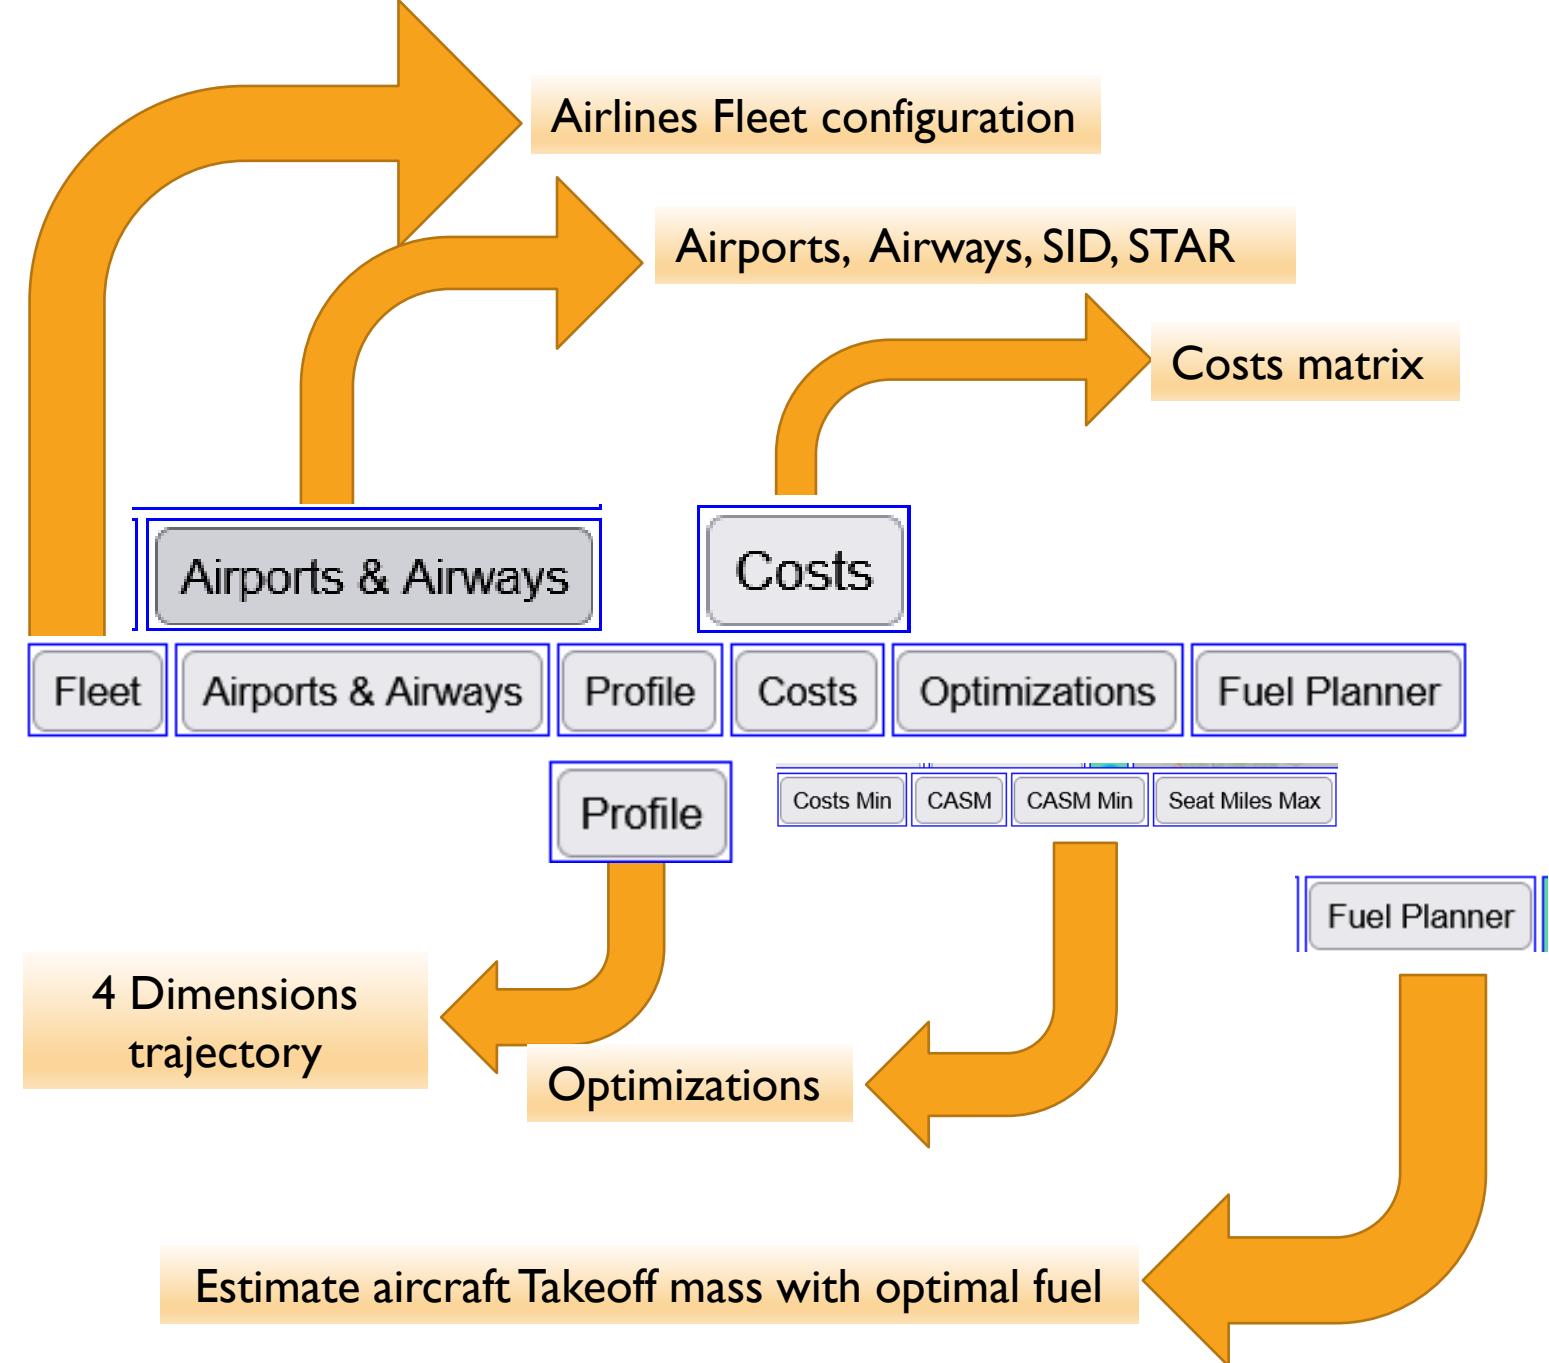

▼Goals

This highly configurable tool allows to build a fleet of aircrafts with departure and arrival airports and their routes. For each flight leg, the tool computes a detailed 4 dimensions lateral and vertical profile. For each leg, it is possible to select a departure and an arrival runway. It is possible also to select a takeoff mass and a cruise level.

For each aircraft, configuration includes hourly operational costs, crew costs. Fuel costs are based upon aircraft mass losses as computed at the end of each simulation. The flight profile provides duration, distance flown and with mass loss, it is allowing to compute overall costs. Current optimizations are focused upon minimizing costs or Cost per Available Seat Mile. Optimizations allow the selection of the best aircraft for each flight leg in order to minimize for instance Costs per Available Seat Miles.

Note: Due to the size of some results table, usability of this tool is optimal on a desktop, laptop computer or a tablet.

MAIN MENU BAR

CONFIGURATION

AIRLINE FLEET CONFIGURATION

Aircraft
ICAO
code

Aircraft ICAO code is used to access aircraft performance data

Values are loaded into a database

Values are specific to each airline

Click here to move -> Airline Fleet Configuration

Click to hide

Airline	Aircraft ICAO Code	Aircraft Full Name	Number of Aircrafts	Number of Seats	Flying Costs per Hour (US\$)	Crew Costs per Hour (US\$)	Minimum Take Off Mass (kg)	Reference Mass (kg)	Maximum Take Off Mass (kg)	Aircraft Turn Around Time (min)
AmericanWings	A320	Airbus A320	2	157	2840	1657	39000	64000	77000	25
AmericanWings	A332	Airbus A330-200	3	234	3300	1857	120600	190000	230000	35
AmericanWings	B738	Boeing 737-800	4	160	3010	1557	41150	65300	78300	25

Not yet used

Used to compute CASM

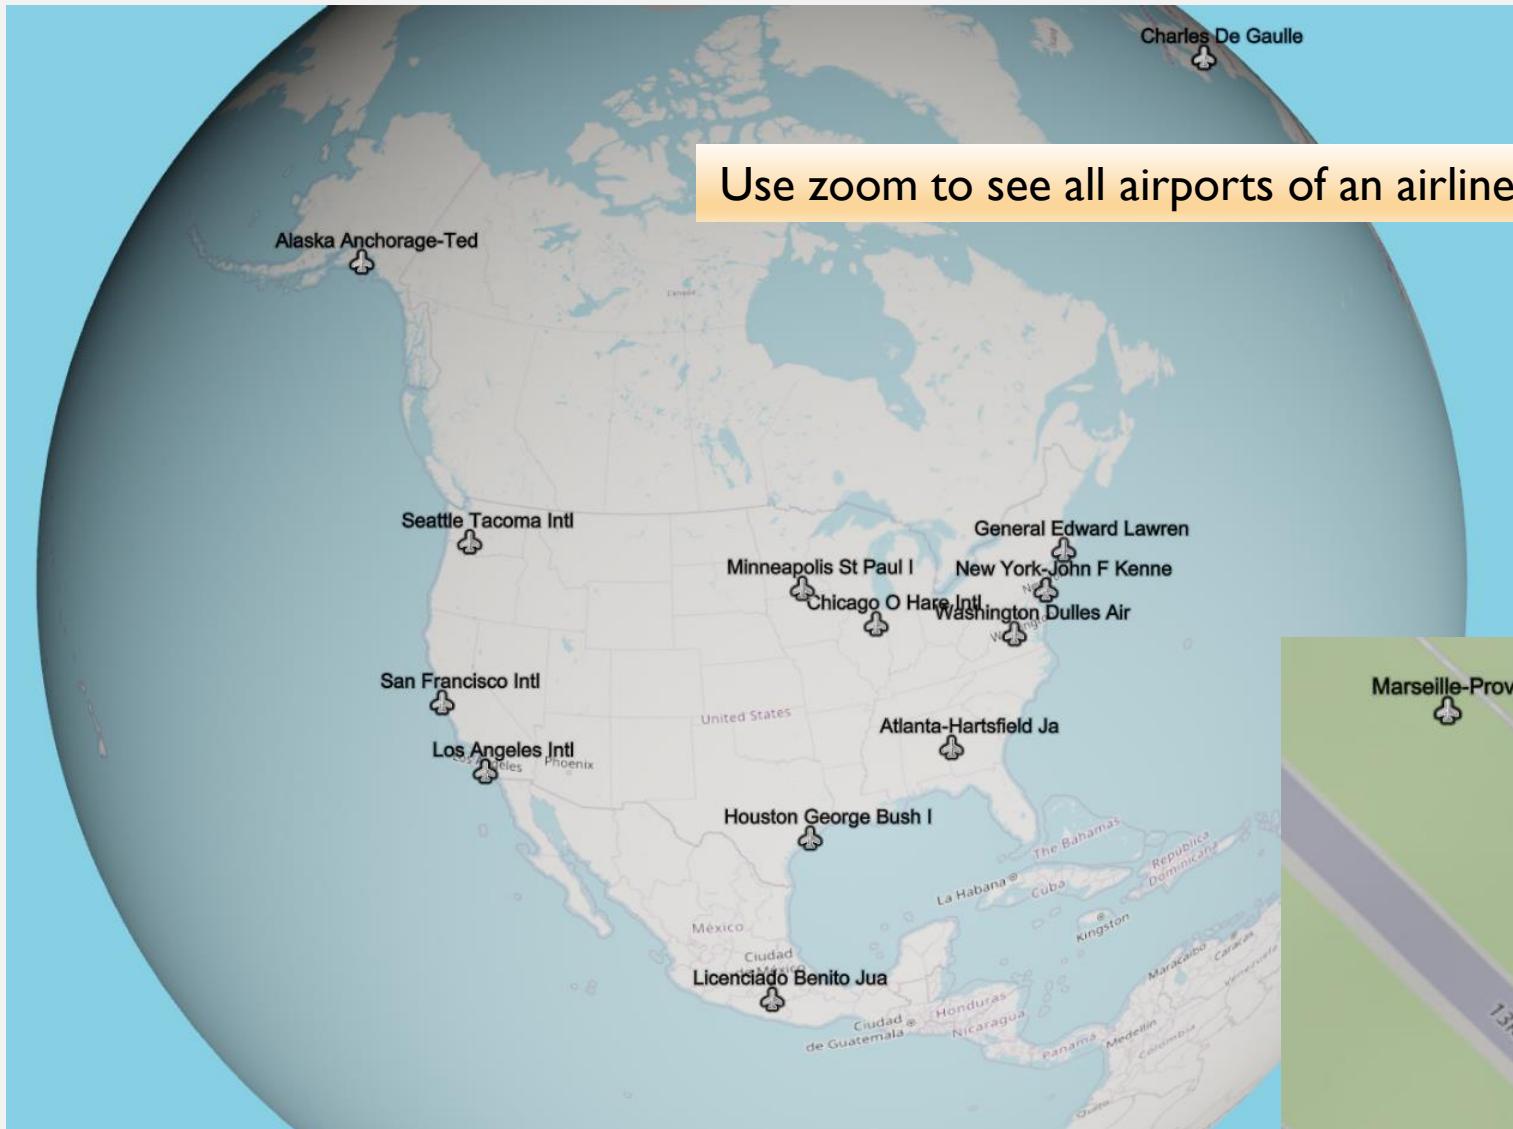

CASM : Cost per Available Seat Miles

Used to compute costs

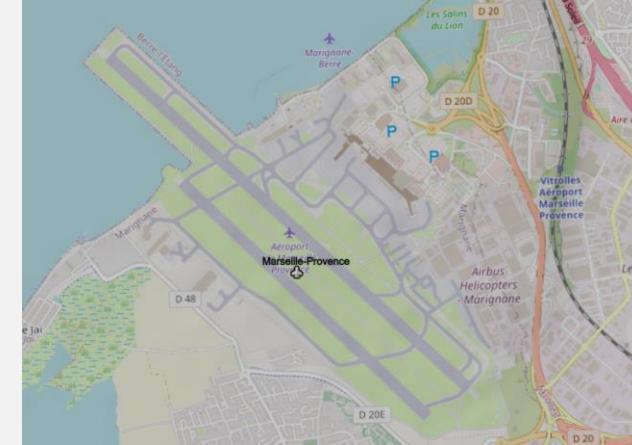

Used to compute profiles

Used to compute airport turn around times -> used to compute Seat Miles

AIRLINE AIRPORTS – MAIN VIEWPORT CONFIGURATION

Street map appears only when « sufficient » zoom is set – street map tile must be available

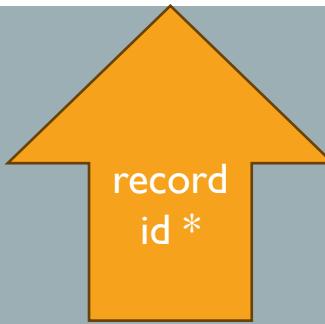

AIRLINES ROUTES

Defines the departure and arrival airports for each airline flight leg / route

Example of database extract for Routes

	id [PK] integer	DepartureAirport character varying	DepartureAirportICAOCode character varying	ArrivalAirport character varying	ArrivalAirportICAOCode character varying	airline_id integer

SID

Click to see the SID on the map

STAR

Click to see the STAR on the map

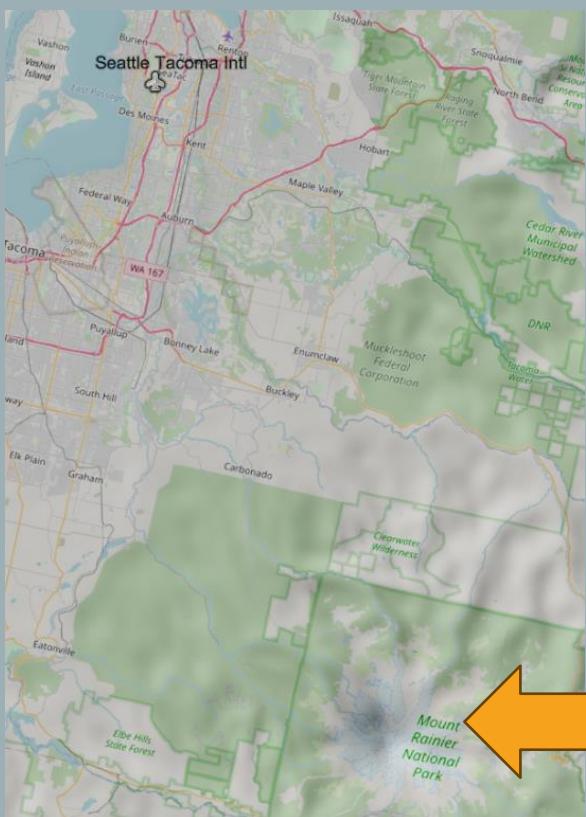

STAR starting from LFPG 26L and joining ERIXU first waypoint of the flight leg

SID & STAR PURPOSE

Purpose : avoid obstacle or noise or air pollution over crowded city suburbs, during climb & approach phase,

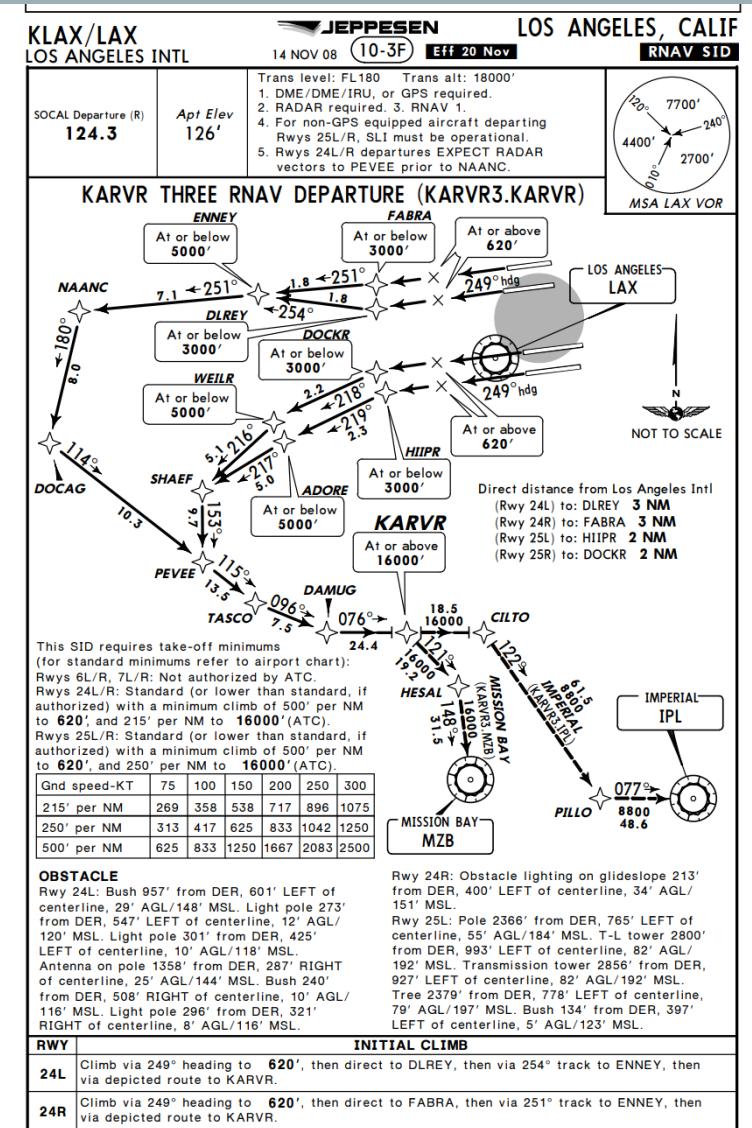

Example : taking off from Los Angeles with sea head wind, the aircraft is following a SID that is climbing with reduced speed hence reduced noise pollution over the sea before turning back to the land to join the flight leg first way point

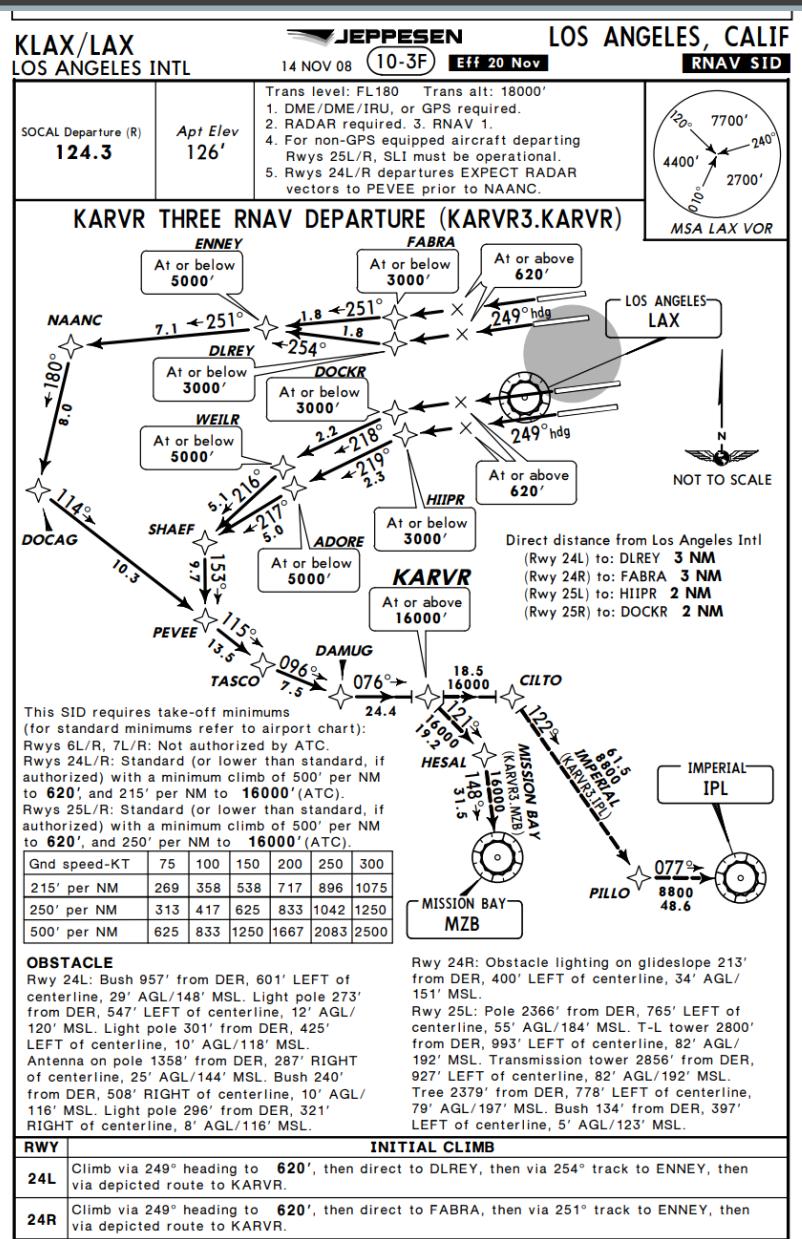

Example : Mount Rainier obstacle avoidance during approach to Seattle from south

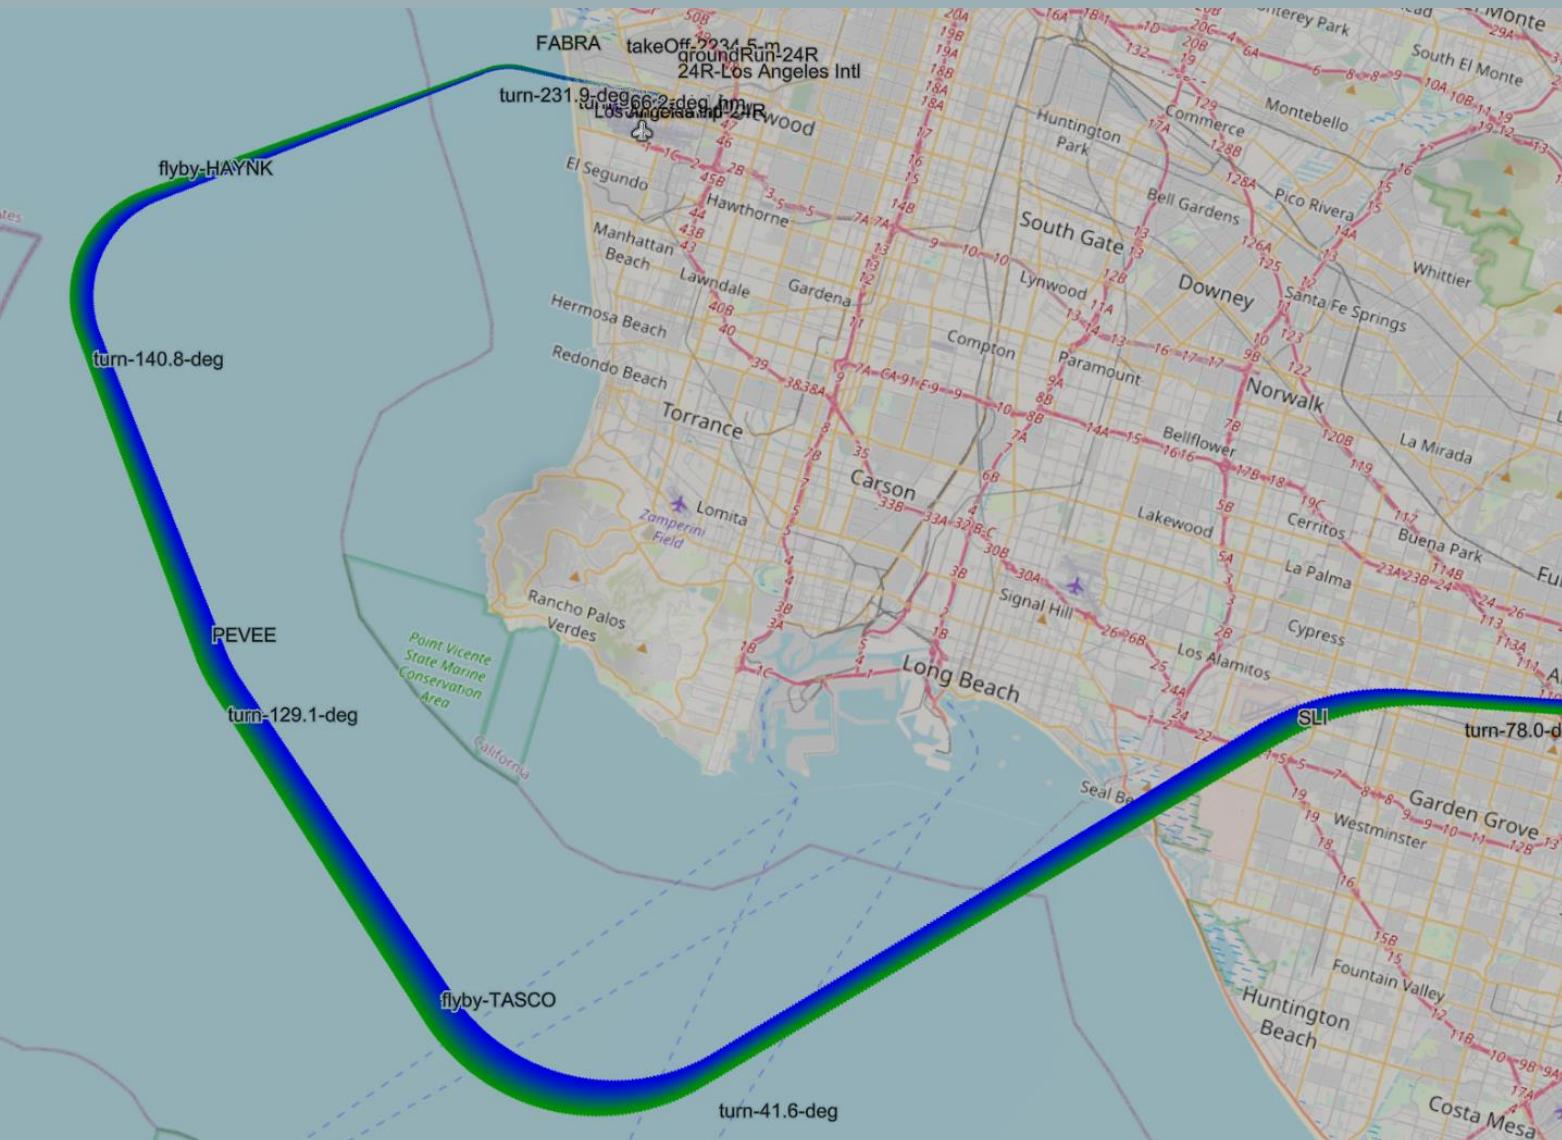

Altitude above Ground

STANDARD INSTRUMENT DEPARTURE (SID) EXAMPLE : LOS ANGELES KLAX/24R TO SLI

Warning : outdated Jeppesen departure chart for demonstration purpose only

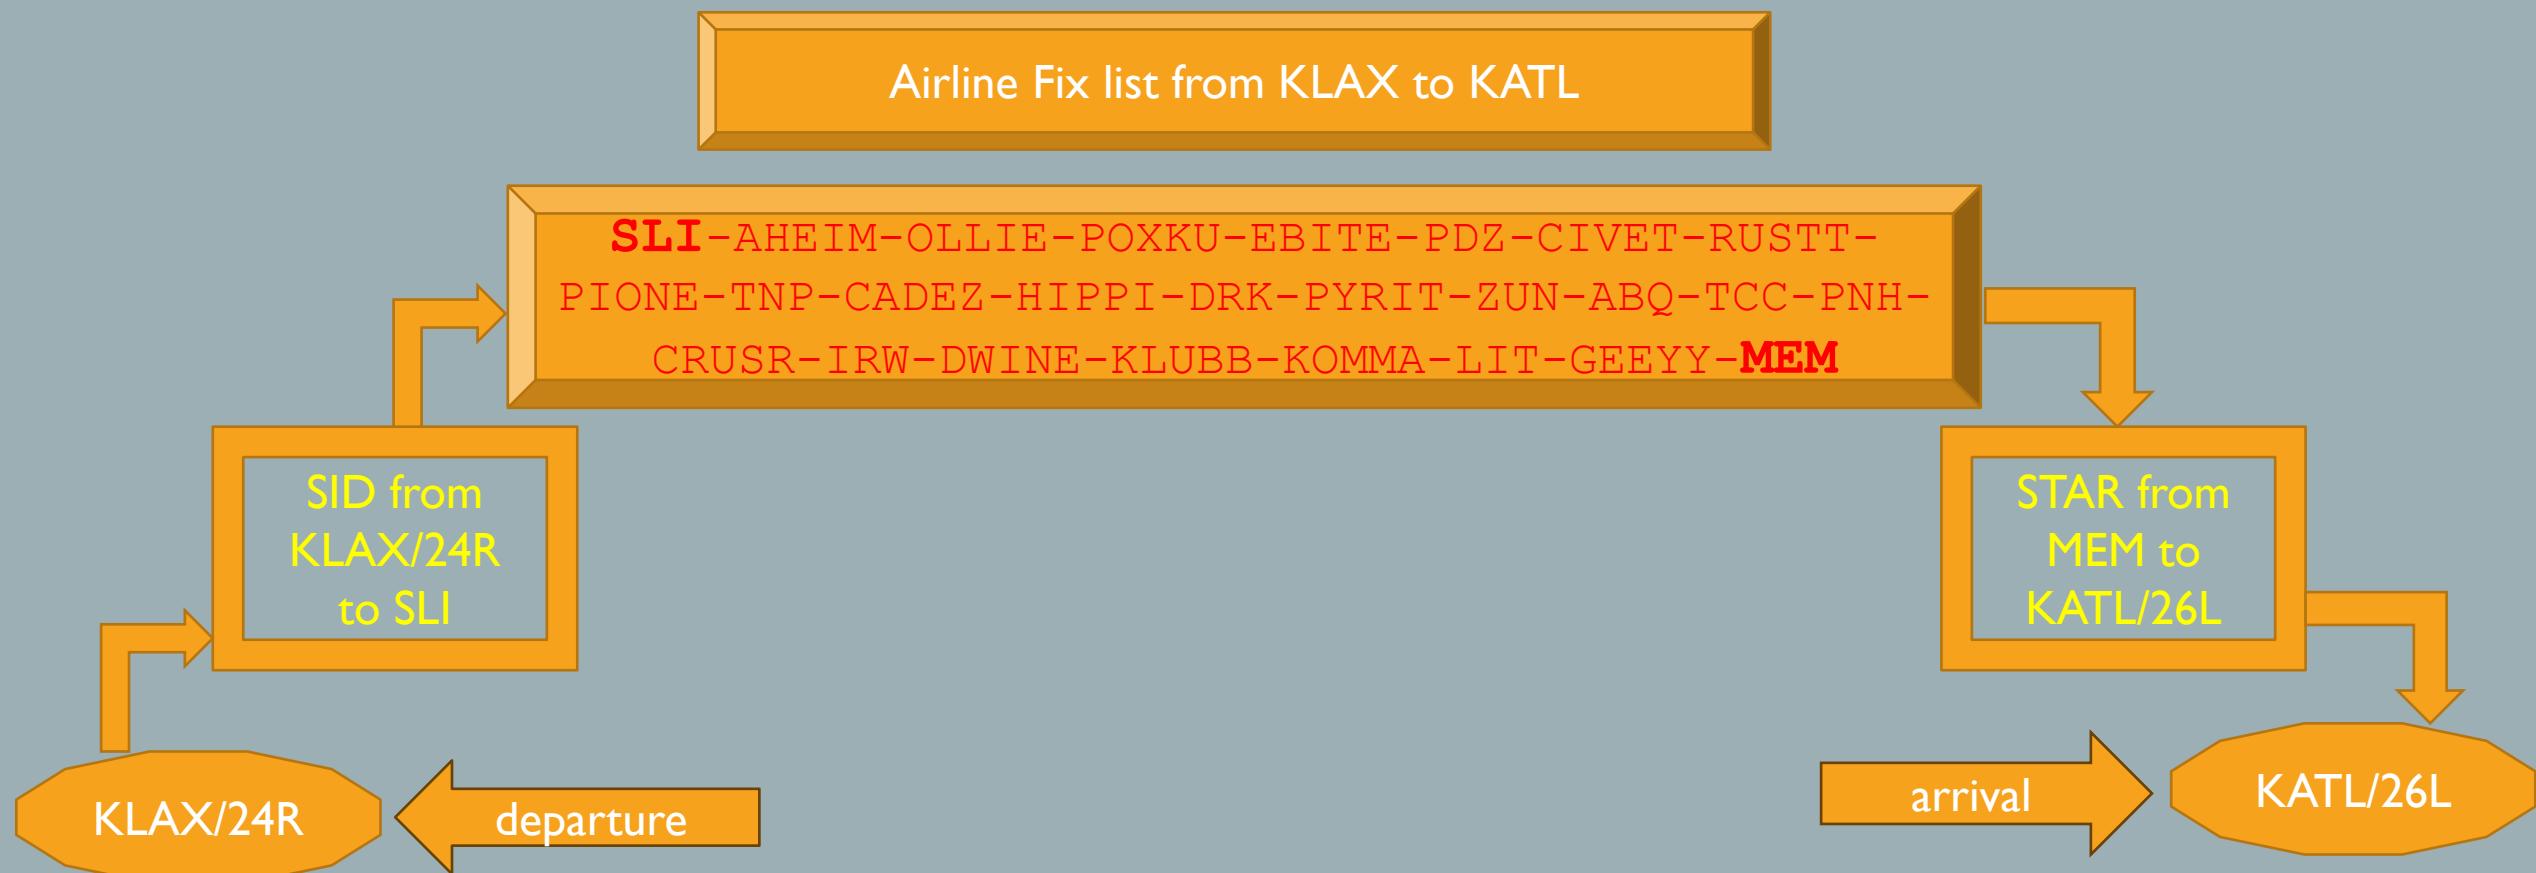

SID & STAR

SID waypoints are inserted in the fix list as soon as :

- 1) Departure airport is matching SID airport
- 2) Departure runway is matching SID runway
- 3) First fix of the route is matching last waypoint of the SID

STAR waypoints are inserted in the fix list as soon as :

- 1) Arrival airport is matching STAR airport
- 2) Arrival runway is matching STAR runway
- 3) Last fix of the route is matching first waypoint of the STAR

SID & STAR DATA

SID & STAR are generic, not related to any airline route

NEW YORK - JOHN FITZGERALD KENNEDY - 22R - SID

SID is defined to avoid noise and air pollution over crowded suburbs while aircraft is flying low

Note: this SID is not yet implemented

STANDARD ARRIVAL STAR (ATLANTA KATL/26L)

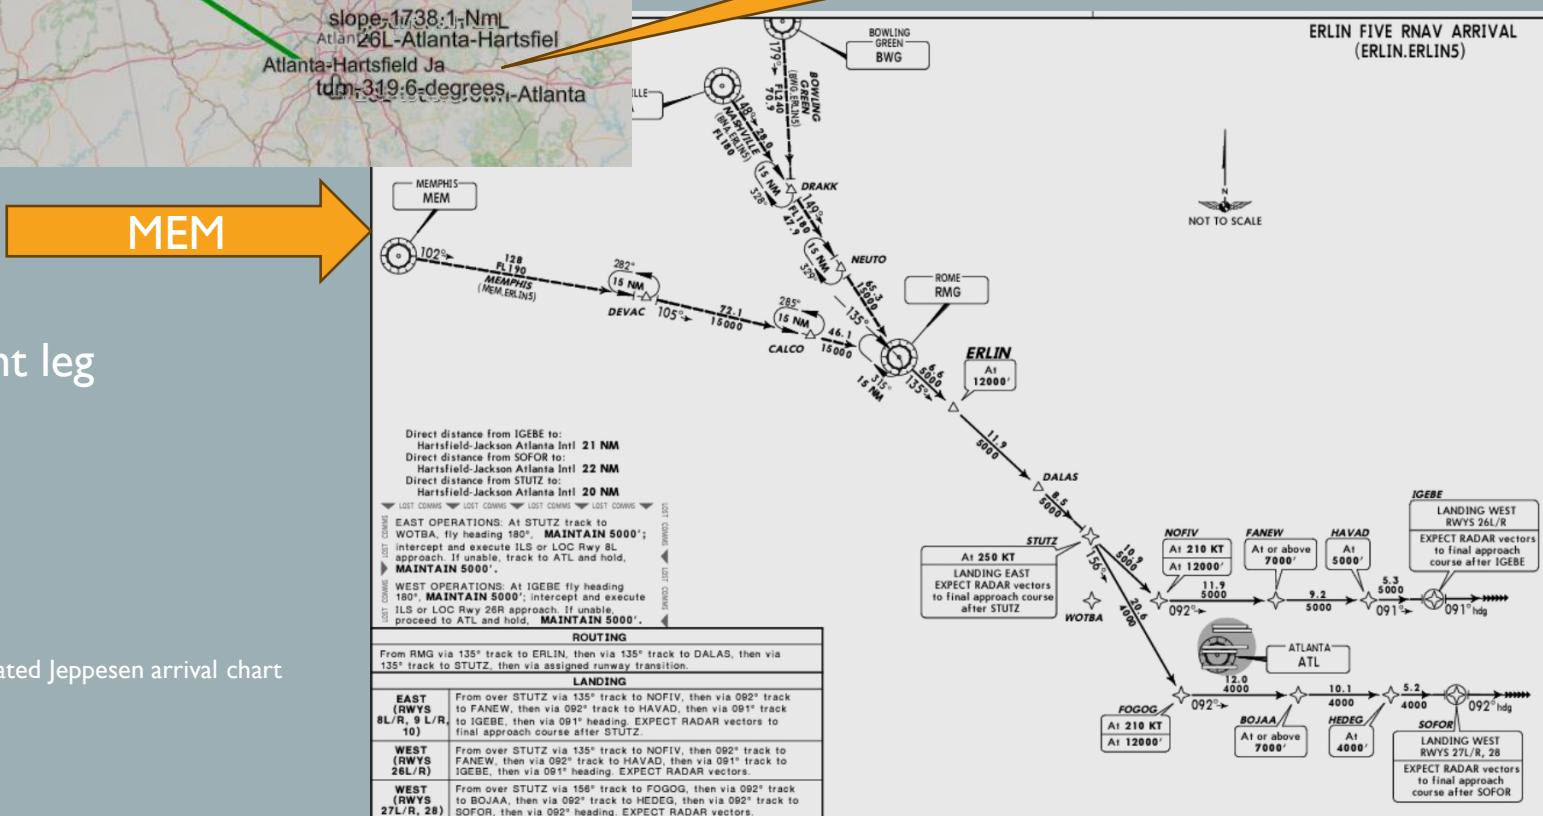

STAR waypoint

Arrival runway = 26L
~ 270 degrees true heading

MEM – Memphis is the last waypoint of the flight leg

Warning : outdated Jeppesen arrival chart

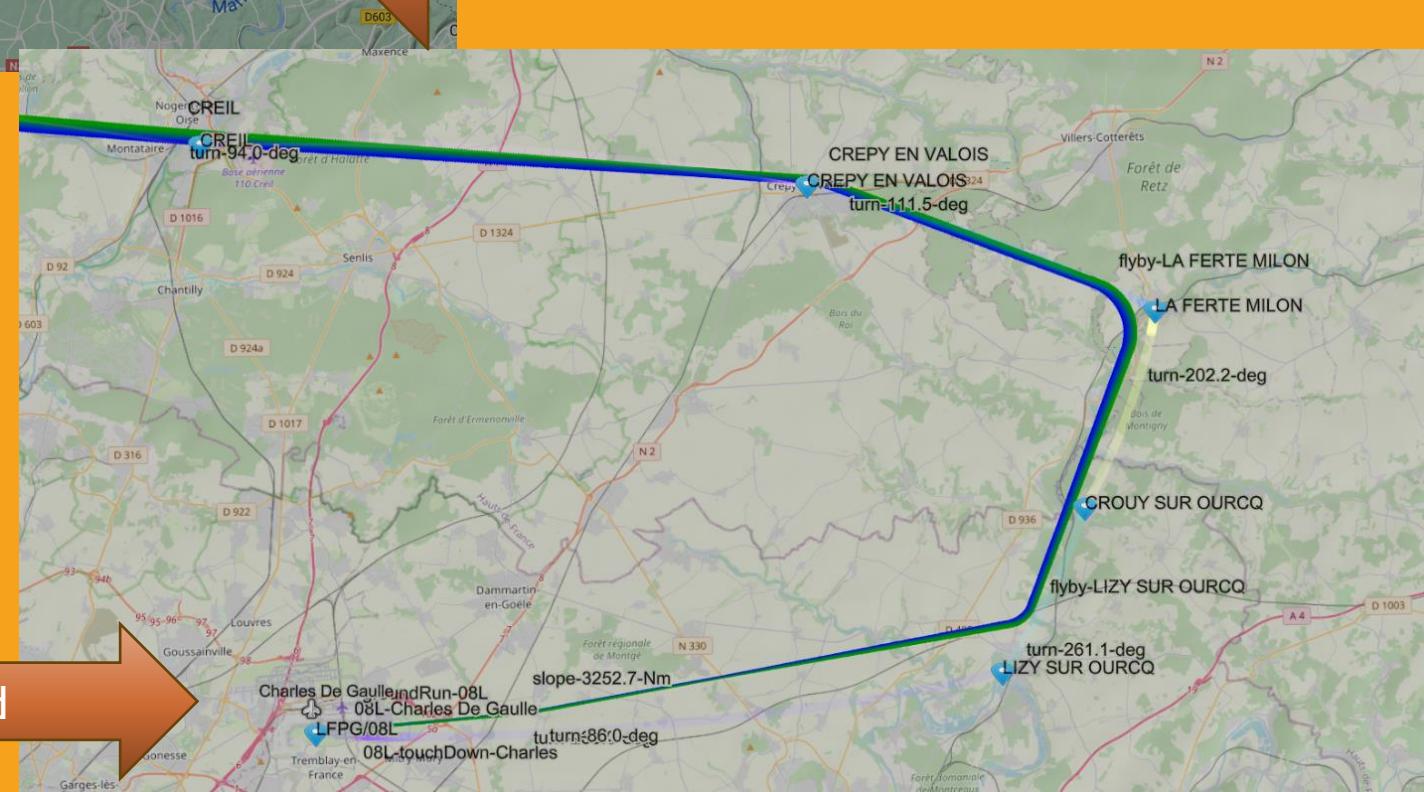

STAR - ALIGNMENT ON THE ARRIVAL RUNWAY

Runways are selected in accordance to head winds

Comparison of alignment on the arrival runway

STAR – OBSTACLE AVOIDANCE

Mexico to Seattle
Arrival using runway KSEA/16L
180 degrees True Heading

Without a STAR aircraft would « crash » into the mountain

10	KSFO	San Francisco Intl	37.618972	-122.374889	3.9624	United States

* PK = Primary key

Name displayed on the map

Each airport is defined by a unique 4 letters ICAO code

RUNWAYS CONFIGURATION DATA

Example of database content for KATL – Atlanta runways

degrees

True heading is the angle computed from the geographical north to the orientation of the runway

	id [PK] integer	Name character varying	LengthFeet double precision	TrueHeadingDegrees double precision	LatitudeDegrees double precision	LongitudeDegrees double precision	Airport_id character varying
1	1	08L	9000	90	33.64950180053711	-84.43900299072266	KATL
2	2	26R	9000	270	33.64950180053711	-84.40950012207031	KATL
3	3	08R	10000	90	33.64680099487305	-84.43840026855469	KATL
4	4	26L	10000	270	33.64680099487305	-84.40550231933594	KATL
5	5	09L	11890	90	33.634700775146484	-84.447998046875	KATL
6	6	27R	11890	270	33.634700775146484	-84.40889739990234	KATL
7	7	09R	9001	90	33.63180160522461	-84.447998046875	KATL
8	8	27L	9001	270	33.63180160522461	-84.41840362548828	KATL
9	9	10	9000	90	33.62030029296875	-84.4478988647461	KATL
10	10	28	9000	270	33.62030029296875	-84.41829681396484	KATL

For one airport, number of Runways contributes to compute the airport turn around time specific part

Future : number of runways per airport will be used to compute Block Hour from trip duration

WAYPOINTS CONFIGURATION DATA

Example of database content for waypoints (one data table for all airlines)

Waypoints configuration are common for all airlines routes

	WayPointName [PK] character varying	Type character varying	Latitude double precision	Longitude double precision	Continent character varying
1	47N050W	WayPoint	47.5	-50	Europe
2	49N040W	WayPoint	49.5	-40	Europe
3	51N030W	WayPoint	51.5	-30	Europe
4	52N020W	WayPoint	52.5	-20	Europe
5	ABQ	WayPoint	35.04379444444444	-106.8163111111112	North America
6	ABR	WayPoint	45.41735277777778	-98.36871944444444	North America
7	ADUKE	WayPoint	31.882430555555555	-94.21646666666666	North America
8	AGROM	WayPoint	22.529163888888885	84.83330555555555	India
9	AHEIM	WayPoint	33.82031388888889	-117.91197222222222	North America
10	ALBED	WayPoint	18.11721944444444	78.6566638888889	India
11	ALEPO	WayPoint	42.343608333333336	-1.963333333333334	Europe
12	AMDID	WayPoint	48.09721944444445	12.396944444444443	Europe
13	ANDAV	WayPoint	17.471666666666664	78.81361111111111	India

Warning: waypoint name (as a key) must be unique for all routes / all flight legs

4 DIMENSIONS TRAJECTORY COMPUTATION

Dimensions are

- 1) Latitude (degrees)
- 2) Longitude (degrees)
- 3) altitude above mean sea level (meters)
- 4) a relative time stamp (seconds) for each previous 3D point with the reference defined when the aircraft release breaks release and put full throttle on the departure runway
 - I) Hence timestamp defines an ordered sequence of 3D positions

PHASES OF FLIGHT EXTRACT FROM EUROCONTROL SKY LIBRARY

Choice is made to start phases when aircraft is on the runway, and pilot receives clearance to take off from Air Traffic controllers

First phase called « ground run » starts when engine power is applied and until aircraft achieves rotation speed -> aircraft nose rises above the runway

Second phase called « take off » when aircraft leaves the ground run until it reaches an altitude of 35 feet above the runway (obstacle clearance) or until landing gear is retracted (whatever comes first)

Third phase called « climb ramp » where aircraft climbs along a 6-8 degrees ramp until its distance from runway is greater than 5 nautical miles or Standard Instrument Departure comes into play

Next phase called « SID » follows Standard Instrument Departure waypoints until first flight leg waypoint is reached

...

Lateral Route

Ground Track

4 DIMENSIONS TRAJECTORY (CORE FEATURE)

Ground run

Takeoff

Approx 8 degrees Climb Ramp on an approx. distance of 5 nautics

First turn – radius dependent upon speed

Great circle

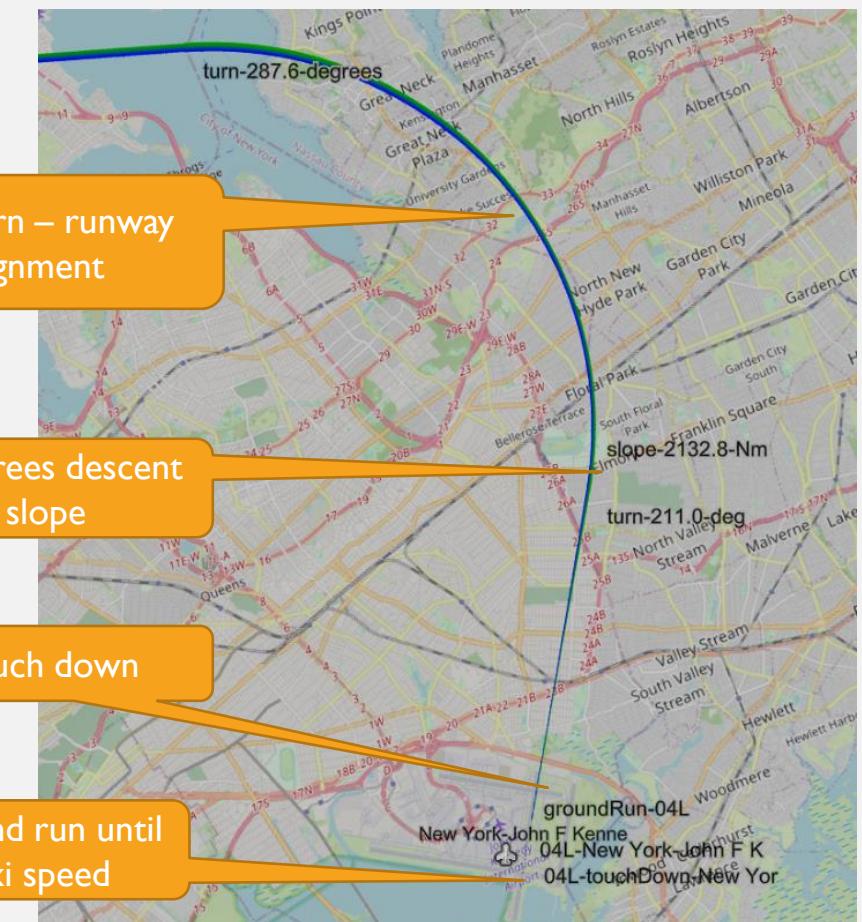

turn radius dependent of true speed and bank angle

Great circle

Ground run until taxi speed

Touch down

3 degrees descent slope

4 DIMENSIONS TRAJECTORY (GROUND RUN)

Airbus A330-200 - TakeOff Mass = 190 tons

Mexico – Mean Sea Level = 2230 meters

Ground Run = 2661,8 meters

TakeOff Speed CAS = 117 knots

TakeOff True Air Speed = 81.21 m/s

Explanation: Air density is lower at Mexico airport MSL = 2230 meters -> true speed must be higher before the take-off

Note : only ISA temperature is used

Airbus A330-200 - TakeOff Mass = 190 tons

JF Kennedy – Mean Sea Level = 4 meters

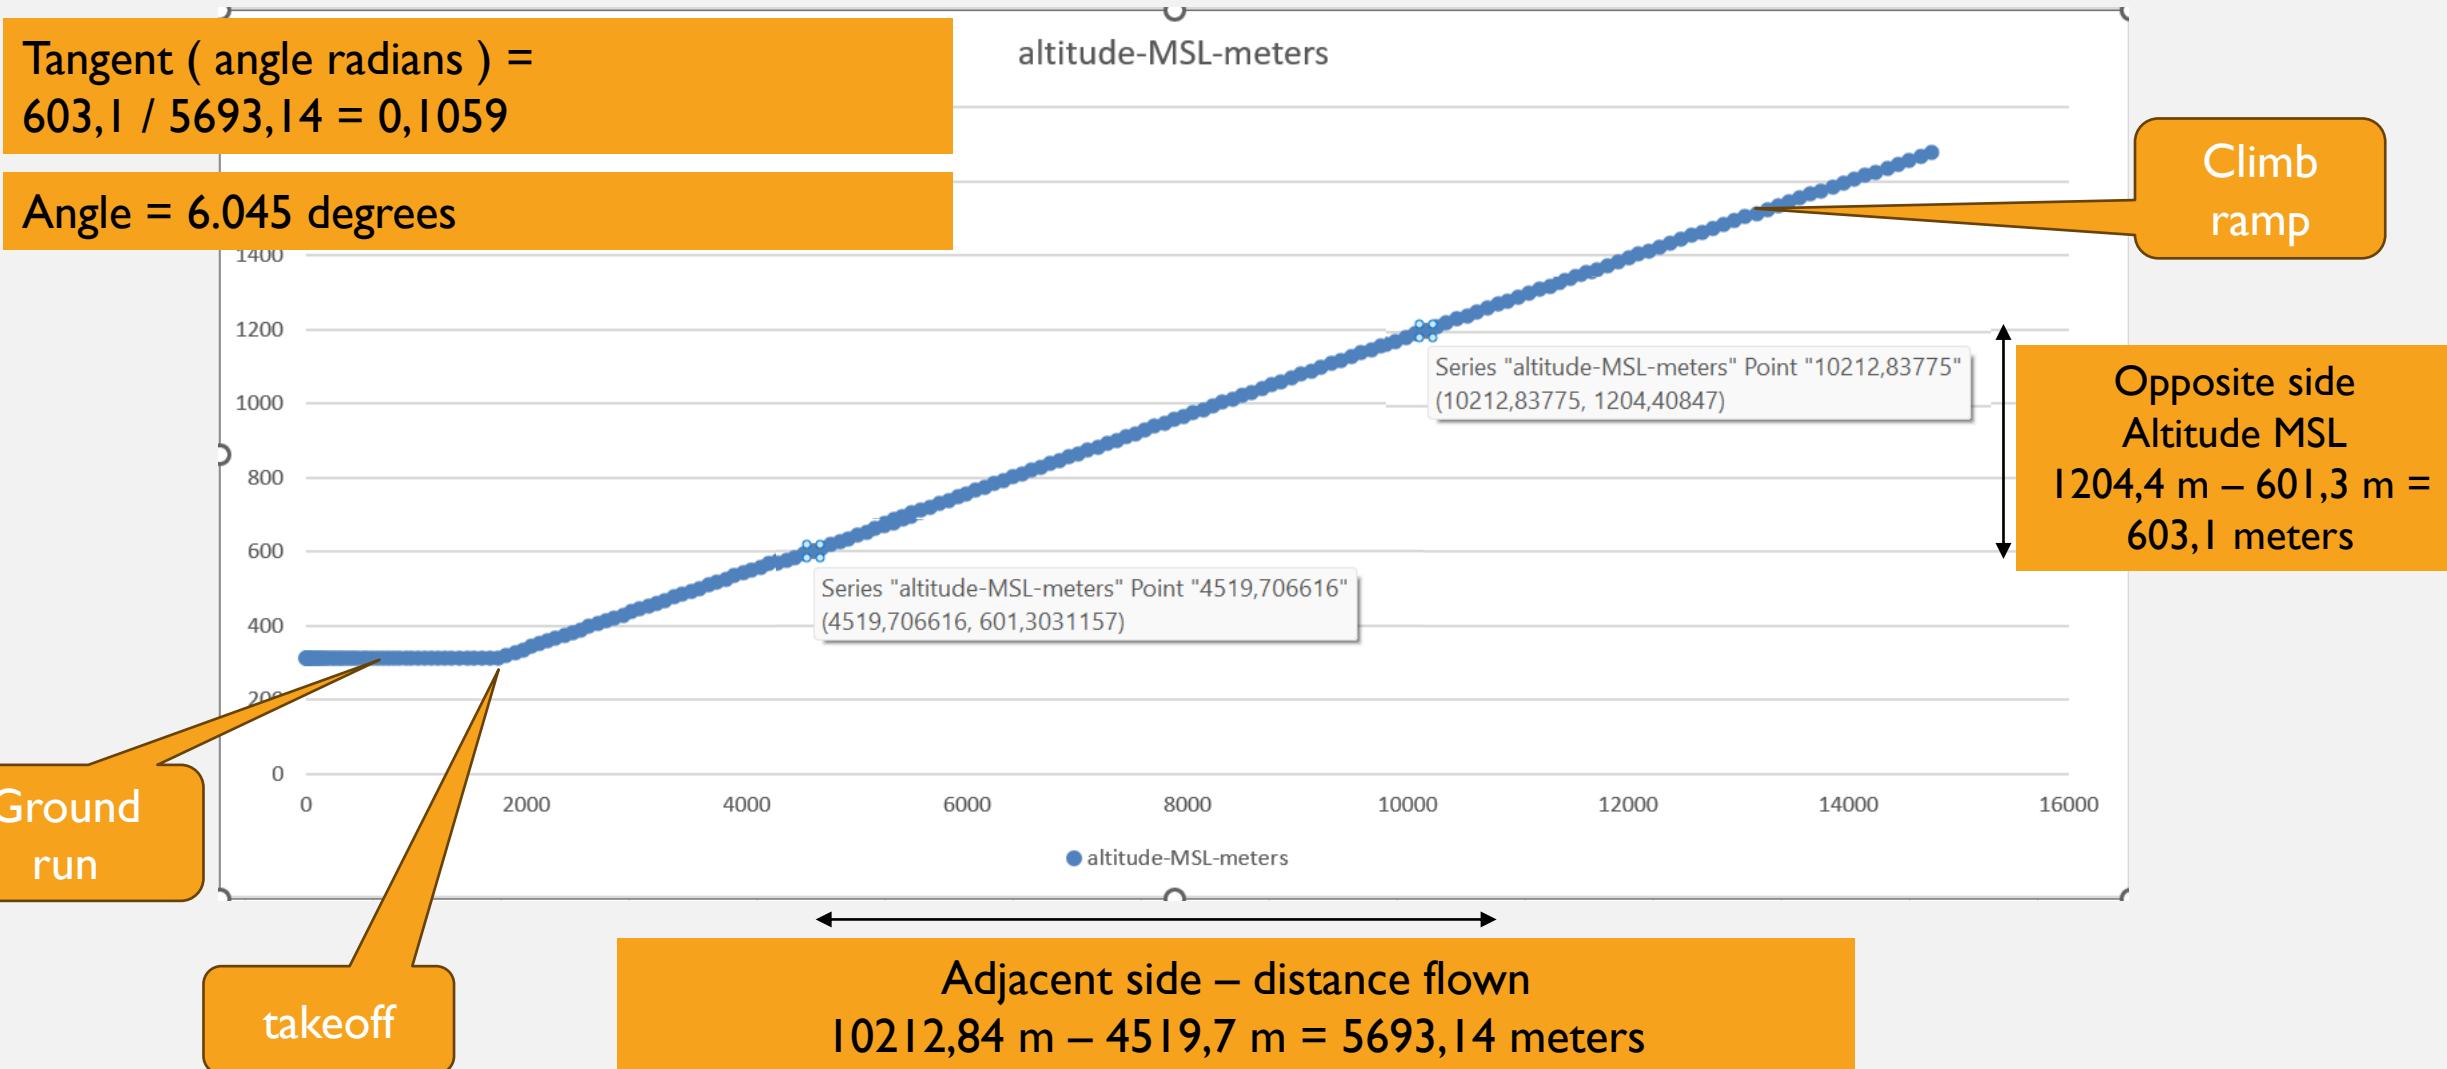

Ground Run = 1779,3 meters

Take Off Speed CAS = 117 knots

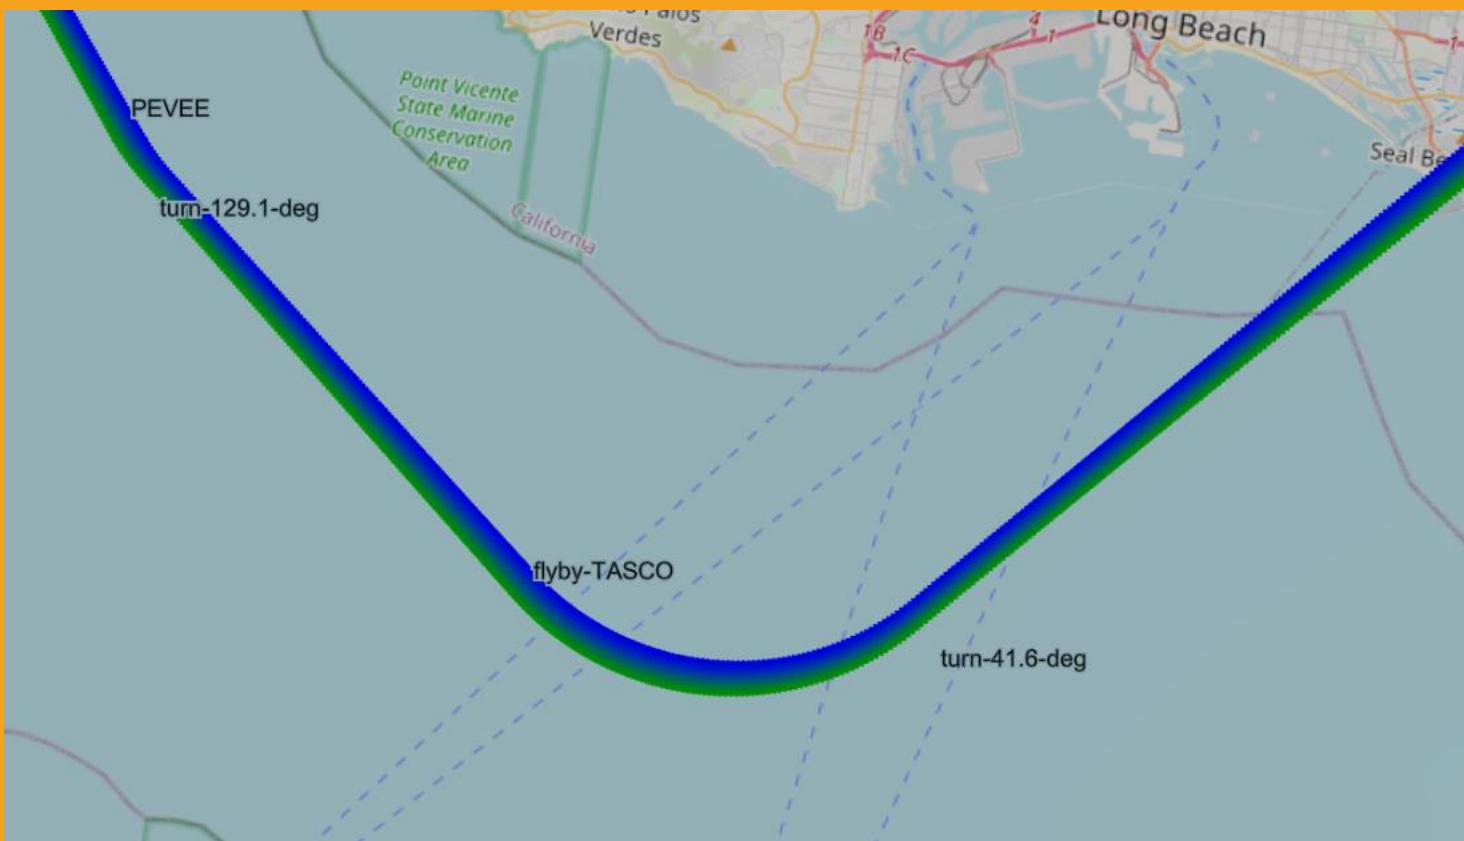

TakeOff True Air Speed = 72,67 m/s

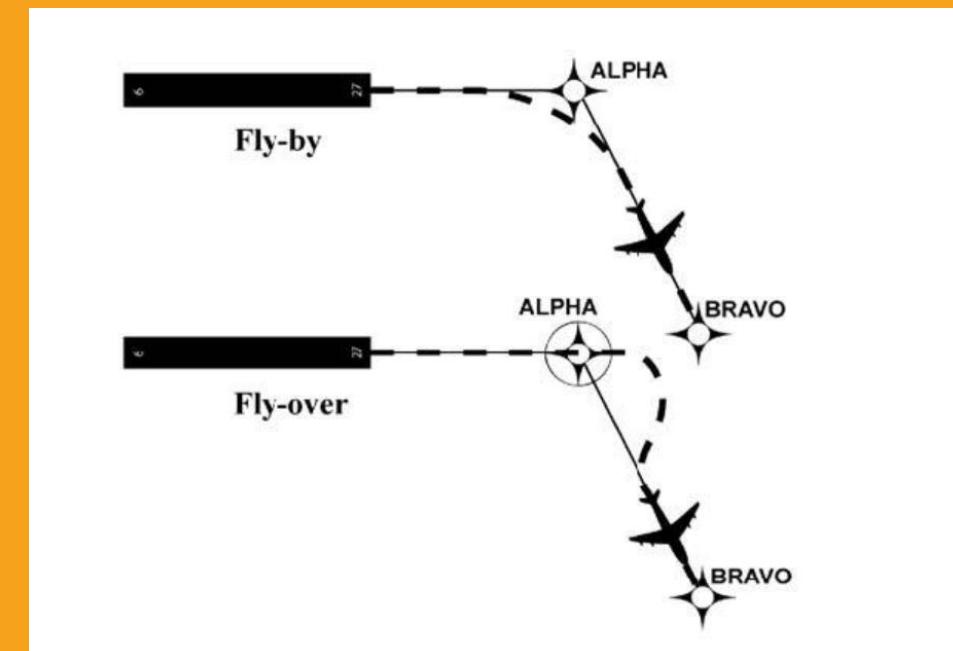

CLIMB RAMP (~6..8 DEGREES – 5 NAUTICAL MILES LENGTH)

TURN LEG

Fly-by waypoints. Fly-by waypoints are used when an aircraft should begin a turn to the next course prior to reaching the waypoint separating the two route segments. This is known as turn anticipation.

TURN LEG

Turn leg radius is a function of True Air Speed and bank angle.

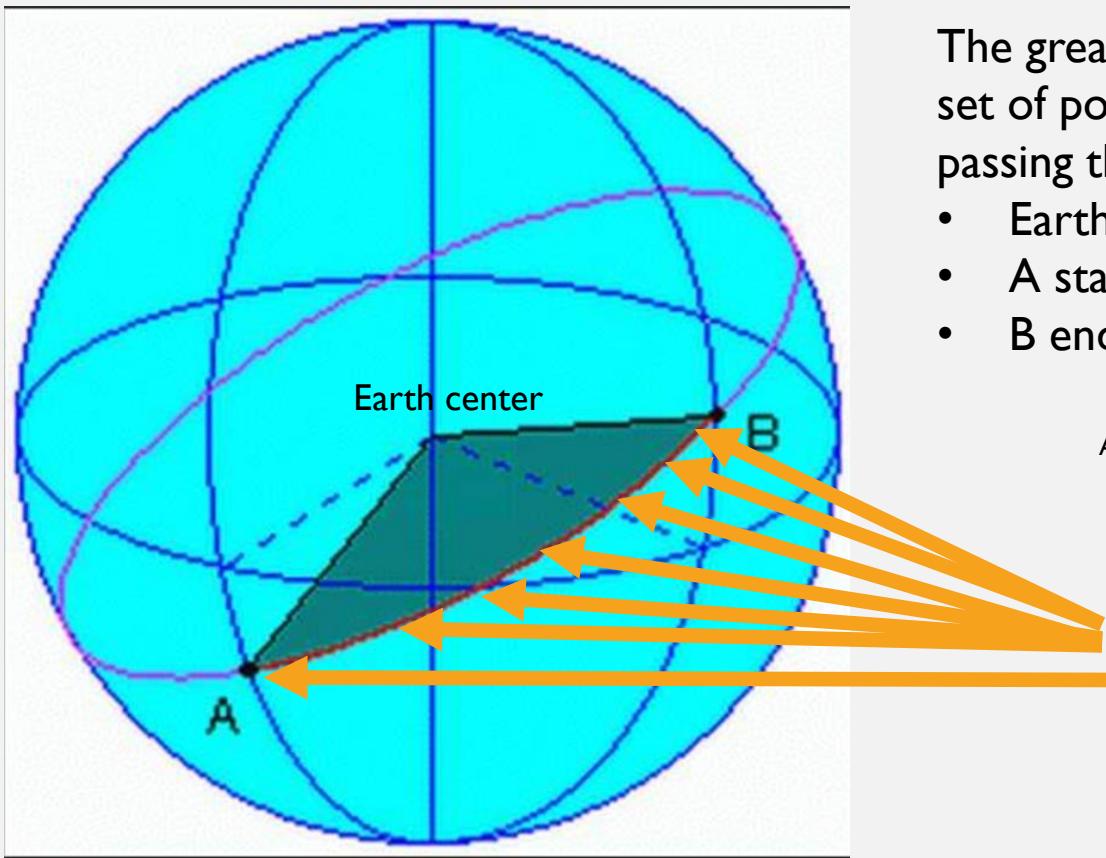

[Aerospaceweb.org | Ask Us - Bank Angle and G's](https://www.aerospaceweb.org/ask-us/bank-angle-and-gs/)

TAS [knots]	Radius in Nautical Miles for a bank angle of 15 degrees	Radius in Nautical Miles for a bank angle of 25 degrees
150	1.2	0.7
180	1.8	1.0
210	2.4	1.4
250	3.4	2.0
300	4.9	2.8
480	12.5	7.2

GREAT CIRCLE (DEFINITION)

Also called [orthodromic](#) route

Shortest path between two points on the globe

The great circle (or orthodromic route) between A and B is defined as the set of points at the surface of the globe intersecting a « geometric plan » passing through

- Earth center
- A starting point of the route
- B ending point of the route

Additional condition : the set of points are along the shortest path (i.e.. not following the other way round the globe)

Great circle route points along the surface of the globe

Use Haversine formulae to compute the shortest distance between A and B

Costs are computed for one aircraft type, one leg, selected runways, a takeoff mass and a flight level

In order to obtain these results a full trajectory computation is launched

Fuel Costs US dollars = mass loss kg * kerosene kg to US gallons * US gallon to US dollars

MINIMIZATIONS (COSTS)

All Optimizations are based upon computing costs beforehand – costs are computed offline

Costs are computed once for all defined routes and results are stored in the database

For each aircraft type, each flight leg a trajectory is computed, and a cost matrix is created and stored offline in the database

Costs minimizations compute the minimal SUM of costs for all the defined flight legs

Assumption : have an adequate fleet in order to assign one aircraft type to only one flight leg

Only one aircraft type
assigned to one leg

Leg = oriented pair of departure and arrival airports

APPLICATION PROGRAMMING INTERFACE

APPLICATION PROGRAMMING INTERFACE

Benefits of API : tool may be queried programmatically & inserted in an eco-system of a more larger tool set

Click on Help Button

In the last help section, see examples of URL to retrieve a JSON answer in the browser

▼API - Application Programming Interface

It is possible to query programmatically the service and retrieve a result in Json format.

Use the following URL : [Fleet Definition](#) to retrieve the fleet definition.

Use the following URL : [Routes Definition](#) to retrieve the routes.

Use the following URL : [Costs](#) to retrieve the costs.

Use the following URL : [WayPoints](#) to retrieve the wayPoints.

Use the following URL : [Airports](#) to retrieve the airports of the airline.

Use the following URL : [Runway overshoot](#) to retrieve the ground run length.

Links to be clicked

DEPARTURE RUNWAY OVERSHOOT (PROGRAMMATIC FEATURE)

Feature to be used programmatically -> Enter the URL below in the browser

Modify arguments such as aircraft, airport, departure runway, takeoff mass

Aircraft Takeoff mass unit = tons

Aircraft Takeoff mass = 230 tons

Paste the following URL in the browser

<https://airlineservices.eu.pythonanywhere.com/trajectory/computeRunwayOvershoot/A332/KATL/08L/230>

Aircraft ICAO = A332

Departure ICAO = KATL

Departure runway = KATL/08L

Receive an answer in JSON format

```
{  
  "aircraft": "A332-AIRBUS-A330-200",  
  "aircraftReferenceMassKg": "190000.0",  
  "aircraftInitialMassKg": "230000.0",  
  "airport": "Airport: Airport: KATL - Atlanta-Hartsfield Jackson Atlanta Intl - lat= 33.64 degrees - long= -84.43 degrees - field elevation= 312.72 meters",  
  "runway": "RunWay: runway= 08L - airport ICAO code= KATL - length= 9000.00 feet - true heading= 90.00 degrees - latitude= 33.65 degrees - longitude= -84.44 degrees",  
  "runwayLengthMeters": "2743.2",  
  "TakeOffStallSpeedCasKnots": "128.73",  
  "groundRunLengthMeters": "2915.39"  
}
```

Runway length from configuration data = 2743 meters

?

Runway length from computation of departure ground run = 2915 meters

Ground run computed runway length **is greater** than configured runway length -> Choose another departure runway or reduce the aircraft takeoff mass

PERFORMANCE OF COMPUTATIONS

PERFORMANCES – ON PREMISE (CPU TIME NEEDED TO COMPUTE ONE FLIGHT LEG)

Processor = i3th Gen Intel(R) Core(TM) i7-1360P 2.20 GHz

RAM = 32,0 Go (31,7 Go usable)

Only 4D trajectory computations only

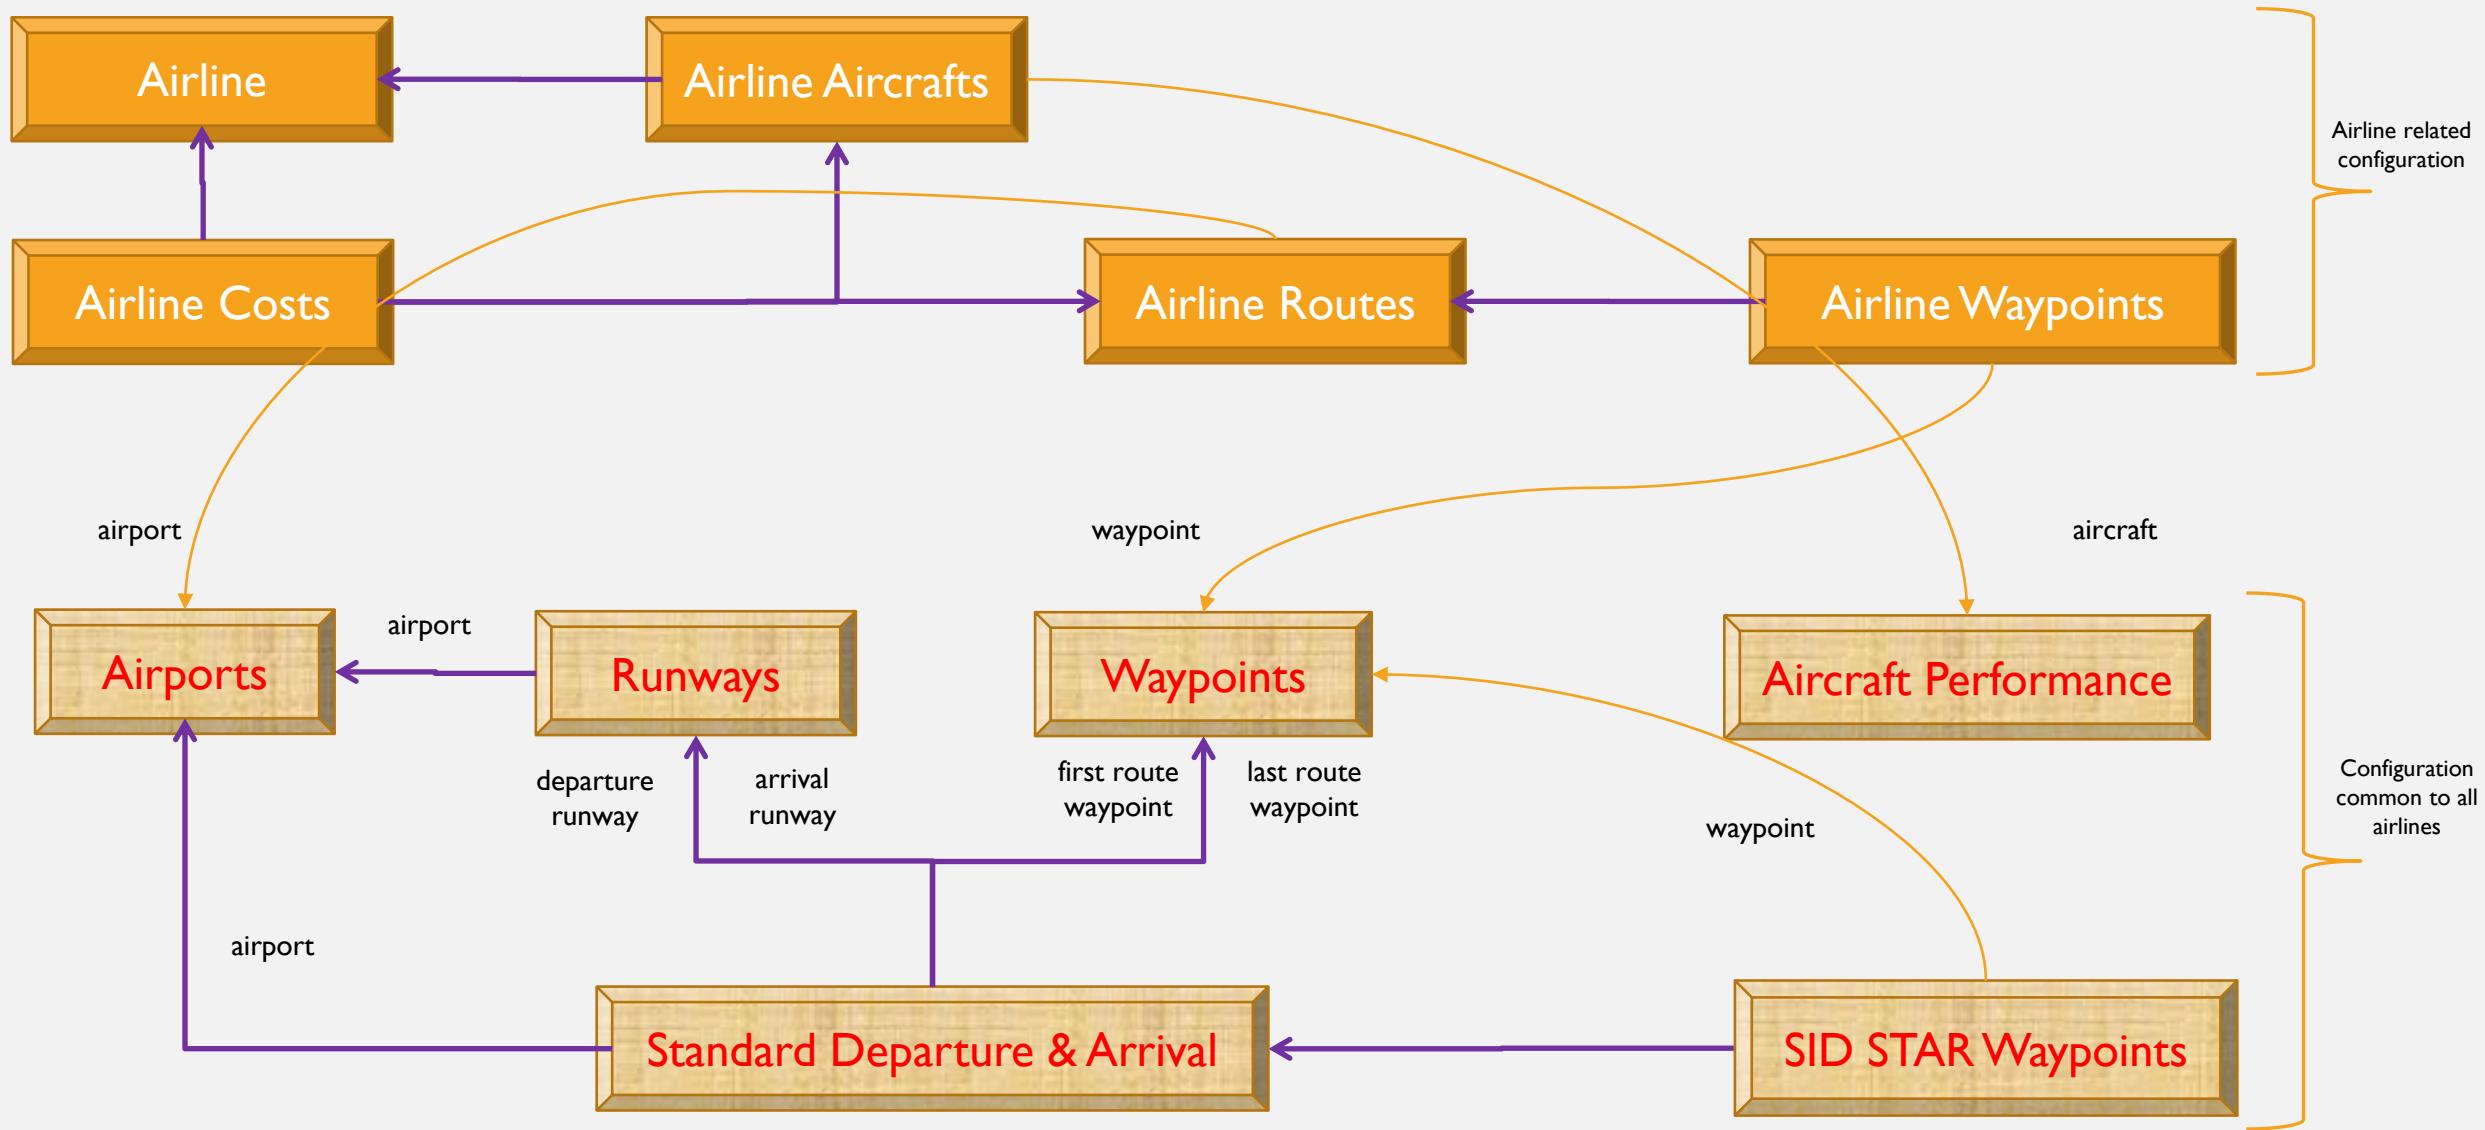

Aircraft	Initial mass	Cruise Mach / Ceiling (feet)	Flight leg	Distance flown (nautical miles)	4D Computation duration	Real time flight duration
A320	67000 kg	0,82 / 39000	Madrid LEMD/36R -> Berlin EDDB/25L	1070 NM	0,86 sec	9664 sec 2 hours 41 minutes
A320	67000 kg	0,82 / 39000	Los Angeles KLAX/24R -> Atlanta KATL/27R	1755 NM	1.0 sec /	15804 sec 4 hours 23 minutes
A320	67000 kg	0,82 / 39000	Mexico MMMX/05L -> Seattle KSEA/16C	2161 NM	2.83 sec	18276 sec / 5 hours 4 minutes

On one leg, performances computation is mostly dependent upon number of waypoints in the fix list

Performances are reduced when code is deployed on PythonAnyWhere

FUTURE IMPROVEMENTS (BACKLOG CONTENT)

- Capacity to compute a flight profile with a Direct Route from departure airport to the destination airport -> to see fuel consumption differences
- Capacity on the Flight Profile menu to click and select automatically the best runways and inform about usage of SID and STAR
- Capacity in the vertical profile to meet speed restrictions (below 10,000 feet above ground) when arriving on a certain airport with applicable noise reduction restriction
- Capacity to compute an optimized vertical profile with a fuel optimization constraint, leading to climb with to reduce power / thrust and apply a continuous descent arrival profile with an idle thrust configuration
- Capacity to compute an optimized vertical profile with a time / duration minimization constraint, leading to climb with max thrust , reach top of climb as soon as possible, reach operational Cruise Mach achieve a minimal flight duration (optimizing the crew costs or ensuring arrival on time)
- Capacity to keep the viewport focused either on a SID / STAR, on the displayed lateral profile, on the waypoints, etc.
- Align airport names -> in the route selector, departure airport is “Aeropuerto Mexico Cuidad” and on the map it is named “Licenciado Benito Juarez”
- Define precisely the amount of available fuel -> case where “no more fuel” event occurs
- Compute “Block Hour” : currently only trip duration is computed (from departure ground run to arrival ground run)
- Number of runways per airport will be used to compute “Block Hour” (time from doors closure to departure runway) from trip duration

KNOWN ISSUE

Cette page ne répond pas

 appsintellect.org

Compute Flight Profile	
Compute Costs	
Download Vertical Profile	
Download KML	

- **Action** : launch the computation of the profile ->

- **Results** :

- the vertical profile is displayed on top of the map
- a ray layer cleaner window is displayed

Click here to move -> layer cleaner

Airline	Departure	Destination	Layer	Action
AmericanWings	KIAH	KORD	Rays-AmericanWings-KIAH-KORD	Delete

- **Action** : click to close the vertical profile and zoom on the map to the selected departure airport / selected departure runway

- **Action** : without changing the airports, select a different departure runway

- **Action** : click to launch the computation of the profile again

- **Results** : the “FireFox” browser gets stuck / frozen temporarily while trying to delete the previous Open Globus ray layer

- Alternative action (to obtain the frozen browser):

- In the Layer Cleaner menu, click on the Delete action button of the displayed route that you wish to suppress
- Consequence is identical -> Browser freezes temporarily (a couple of minutes)

Click here to move -> layer cleaner

Airline	Departure	Destination	Layer	Action
AmericanWings	KIAH	KORD	Rays-AmericanWings-KIAH-KORD	Delete

HISTORY OF CHANGES

Date	What	Where
25th June 2023	On an airport right click contextual menu show both departing and arriving flight legs	Airport contextual right-click menu
1st July	Display default reference mass in Profile compute menu (instead of Max Takeoff mass)	In Flight Profile menu
8th July 2023	Cleaning of Open Globus layer	Additional window to allow for clearing an existing flight leg ray layer (experimental feature)
16th July 2023	Departure Runway overshoot aborts the computation	Computation of departure ground run leg
22nd July 2023	Add browser recommendation to use FireFox	In the pdf presentation file (to download)
30th July 2023	Reduced Climb Power Percentage	Input added in Profile computation menu
6th July 2023	Latitude and longitude shown on the map as degrees & minutes (instead of decimal degrees)	See earth coordinates area in the bottom right of the map
10 th August 2023	Reduce size of KML file, record only every 10 th point in the trajectory	In the Flight Profile menu when launching KML computation
15 th August 2023	In the Profile menu, add checkboxes to select the Best Runway	In the Flight Profile Menu
10 th September 2023	In the EXCEL State Vector, second column contains either characteristic point or flight phase	In the EXCEL state vector output (vertical profile)
